

VAGINAL & RECTAL PROBES

For accurate visual guidance during laparoscopic hysterectomy and posterior cul-de-sac dissection.

These simple, effective instruments are indispensable tools for the laparoscopist. The Vaginal Probe (blue anodized handle) helps the surgeon map the posterior extent of the vagina and aids in opening the retrovaginal pouch.

The Rectal Probe (gold anodized handle) makes identification and excision of lesions easier and reveals the course of the rectum.

Both devices also serve as effective mobilizers to facilitate dissection and suturing.
